LOG NO. 24

Foreword

With the publishing of this our No. 24 Catalog, we are illustrating a large and varied assortment of new and modern Lighting Fixture Designs many of which have never before been cataloged. These fixture designs are the conceptions of our own expert designers and engineers, assisted by many eminent architects and hospital superintendents and are authentic for Hospitals, Schools, Public Buildings, etc.

From the raw material to the finished product every operation is handled under improved methods and with the most modern machinery. Each operation is carefully inspected before a Guth Fixture is ready to be shipped. Because of the great care taken in manufacturing and shipment, Guth Equipment may be confidently relied upon for immediate installation.

Where design and construction permit, Guth Fixtures are stamped from a single piece of heavy Armco iron with 3 coats of permanent porcelain enamel fused on at 1600 degrees Fahrenheit, in our electric enameling furnace. Our heavy porcelain enamel is of vitreous glass material, non-porous, and its electrical insulation resists penetration up to 1200 volts. This process insures a perfectly smooth surface and is guaranteed not to peel, check or tarnish. Guth Fixtures are made in the largest and most completely equipped plant in the industry.

All prices in this Catalog contemplate our furnishing the material complete with exception of electric lamps, wired and assembled, as far as practical for safe transportation. No packing or boxing charges. All prices F. O. B. St. Louis.

If glass other than illustrated on fixture is ordered the correct price can be arrived at by deducting price of glassware illustrated (by referring to price list on inside of back cover) and adding in lieu the glassware ordered, which will give the list of complete fixture.

On designs which appeared in previous Catalogs under other numbers and are now shown in this issue the prices and numbers listed herein supersede all previous listings.

Terms: To all concerns of satisfactory credit rating—1% 15 days, net 30 days.

Description

The high efficiency of the Brascolite is obtained by the arrangement of the bowl and reflector which direct all the emitted light rays to the working plane with a minimum of absorption. Brascolite photometric tests show an average efficiency of the Brascolite over 80%. The Brascolite carries its own ceiling, therefore, it is independent of room ceilings in height, shape or color.

Because of Brascolite's wide light distribution and better illumination, fewer units are required with a result that a considerable saving is made in current consumption. Low maintenance cost is brought about by the low rate of depreciation rugged construction and everlasting porcelain enamel finish. The permanent porcelain enamel finish on the reflector simplifies cleaning. By merely rubbing with a damp cloth the original lustre is renewed. The porcelain enamel is guaranteed not to check, peel or discolor. Releasing one hook provides easy access to the interior of the bowl for relamping and cleaning.

Brascolite reflector is finished in a pale cream color with a band of crimson on the outer edge. The bowl is decorated in silver gray and red. The Brascolite can be furnished in three sizes and four styles, decorated and plain ceiling type, and decorated and plain with chain hanger. Brascolites are packed complete except lamp, in jute package. It is the simplest unit to install.

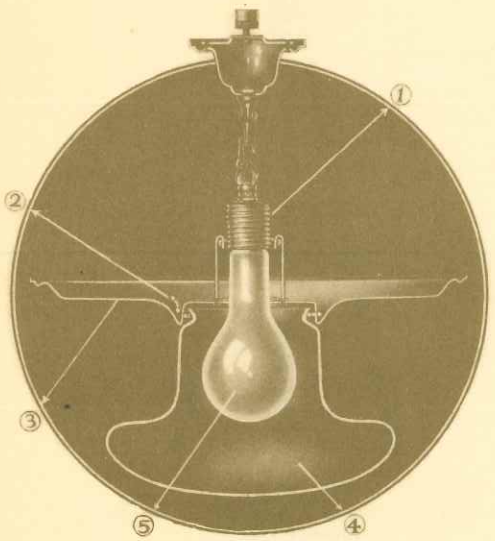
Pull Switch $1.50 List Additional Extra Length $0.35 List Per Foot



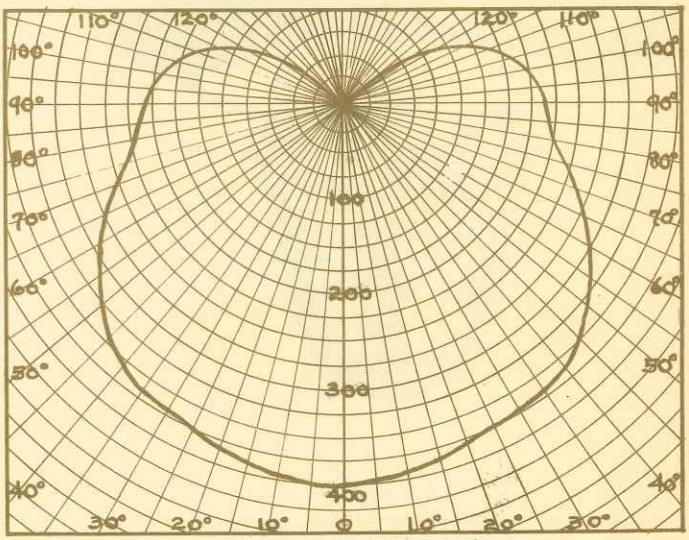


Photo-metric light curve showing wide distribution of light

1. New Guth Fixture Supporting Socket. Threaded outside permitting easy adjustment of reflector. Controls amount of up or downward light.

2. Globe Holder of simplest spring type. Safe, elastic and concealed. Ordinary ones absorb about 7% of the light rays, whereas Guth Lite utilizes this for ceiling illumination.

3. Reflector of White Glazed Porcelain Enamel. Adjustable. Controls and redirects the upward light rays to the useful plane.

4. Globe of scientific design. Produces maximum light output, control and diffusion. Wide lower part reduces glare and conceals bright neck. Top of extended portion of globe so shaped that settling dust will not be seen and absorption will be negligible.

5. (Mazda Lamp) Positioned high so that hemisphere is uniformly lighted and is low in brightness. This construction also provides a cool lamp.

High Efficiency

Decorative

The Guth Lite is a totally inclosed unit that gives a scientifically correct, diffused and redirected light without glare. Its light rays are distributed vertically, horizontally and at an angle. Guth Lite gives a very wide light distribution so that fewer units are needed to light a given area. The patented features of Guth Lite facilitates installing, cleaning and relamping. It is the lowest priced unit of its type on the market, made in three sizes and four styles, both in chain hanger and close ceiling type.

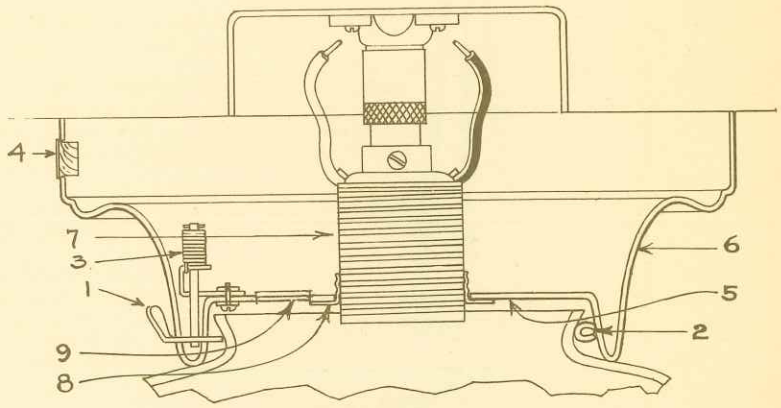
Guth Flange

is a constant recommendation for the one installing it. Put in with the greatest ease and rapidity. Offers the utmost in beauty, efficiency and safety. The self-adjusting spring glass holder obviates rattling or breakage; instantly engages or releases glassware; no bothersome set screws. It is dust-proof and has a perfectly smooth, glossy porcelain finish that is easily cleaned. Assures more useful light because within, as well as outside the glass, it reflects light. Inside air space protects ceiling and wiring from heat. Approved by fire underwriters. Ideal for use in Schools, Offices, Stores, Public Buildings, Hospitals and Kitchens. Holds any standard glassware.



1. Patented spring key for engaging or releasing glass. The spring action of the key allows for expansion of glass, thus reducing breakage to a minimum.
2. Two (2) lips for holding glass.
3. Everlasting bronze spring governing key which holds glass.
4. A ⅜″ enameled wood knockout for attaching switch.
5. White Porcelain reflector surface inside glass insures maximum light on the working plane.
6. Porcelain enamel reflector surface outside the glass insures efficient distribution of light.
7. New Guth Fixture supporting socket furnished with ⅜ extension nipple to attach to fixture stud of proper length when outlet box is flush with ceiling.
8. Lock ring for locking flange to socket; slip flange over socket and screw on lock ring.
9. Slot cut out so that wire connections can be made when switch is used. Slot is large enough so connections can be pushed back leaving reflector surface clear.

Superiorities Not Illustrated on Cross-Section

Non-vibrating, Self-adjusting, Dust-proof. No visible screws.

Globe applied or removed in an instant for cleaning or relamping.

Made of Armco-Rust-Resisting Iron with PERMANENT PORCELAIN ENAMELED FINISH. Our heavy porcelain enamel is vitreous glass material, is non-porous and its electrical insulation resists penetration up to 1200 volts. Very efficient; lasts forever.

Easiest Two-Piece Holder to Install

MOST SIMPLE AND ATTRACTIVE HOLDERS MADE
DESIGN –SAFETY –CONSTRUCTION

THE DESIGN

THE NEW GUTH SCREWLESS SAFETY TYPE HOLDERS are made in both Ceiling and Suspension type in 4, 5 and 6 inch fitter to accommodate all sizes of lamps up to and including 500 watt. Made in both Plain and Ornamental designs.

THE SAFETY

Tipping an external ring slightly allows glass to slip into the holder, which has two flexible metal lugs properly shaped to fit contour of glassware.

The Safety Ring which has one flexible metal lug is then allowed to slip back into place and glassware is automatically centered and secure and needs no locking device as many safety holders require.

It is impossible to cause any breakage of glass by reason of expansion as there is no binding upon glassware.

CONSTRUCTION

Ceiling Type is made of 22 gauge B & S steel stamping, udylite plated. The patented Guth Socket is furnished with ⅜″ nipple to connect direct to fixture stud. Fitter is then screwed onto socket (which has running thread) and locked with large lock ring to assure double safety. All installation parts entirely concealed within the base.

Suspension type is made of same gauge steel and fitted with patented Guth Socket. Canopy is furnished with stamped steel bridge which can be screwed to lips of any standard outlet box or can be connected to fixture stud by means of coupling. Both fittings are furnished with each fixture. Knock outs in both ceiling flange and canopies for switches.

AGLITE

Porcelain Enamel Finish

Method of Installing Aglites and Bracket Types

Bridge (No. 1) is attached to any standard outlet with locknut furnished. Attach house wires to porcelain socket (No. 3) and clamp it in Canopy (No. 5).

Place canopy in position towards ceiling (for wall) with screws (No. 2), projecting through Keyhole slots (No. 4).

Turn canopy to right and tighten screws (No. 2) with screw driver.

Glass shade (No. 6) is then placed over Bakelite screw collar of socket and held in position by patented, internal threaded collar (No. 7). When light is installed no metal parts are visible.

The AGLITE line of porcelain enamel units is ideal for use wherever cleanliness and sanitation are paramount. They harmonize perfectly with the interiors of white tiled bathrooms, kitchens, hospitals, laboratories, etc.

AGLITE canopies are stamped from a single piece of heavy gauge Armco iron and three coats of permanent porcelain enamel are then fused on at 1,600 degrees Fahrenheit in our electric porcelain emaneling furnaces. This process insures a smooth surface that is self-insulated and is guaranteed not to check, peel, tarnish, rust or discolor.

No metal parts are visible, as AGLITES require no projecting set screws. The pure white glass shade is attached by means of a concealed metal screw collar which holds the glass firmly in place yet permits its adjustment in the bracket types so that the light may be directed wherever required.

A damp cloth rubbed once over the fixture makes it bright and clean.

Installation is made direct to house wires in five minutes with only screw driver and pliers, No canopy insulator is required. No splicing, soldering or taping of wires is necessary.

Standard colors—White, Solid Ivory, Solid Grey, Shaded Orchid, and Shaded Apple Green.

All parts furnished ready for installation.

Ideal for use in Bathrooms, Dressing Rooms, Kitchens, etc. Also in the Home, Hotel, Hospital, Club and Office.

The REFLECTOR is made of one piece of Armco Iron porcelain enameled white inside and old ivory outside. Canopy and chain also finished in old ivory. The finish is permanent and guaranteed to maintain its original lustre indefinitely.

HIGH EFFICIENCY is assured due to the large reflecting area and all shadows are eliminated by the diffusing reflecting characteristic of the pure white glazed porcelain enamel which is obtained by special enameling glass baked on at a high, even temperature in electric enameling furnaces.

The EFFECT is an even distribution of soft, comfortable light without glare or shadows.

CLEANING AND RELAMPING are simplified through the means of suspending the bowl. Unhooking one of the supports permits instant access to reflector surface, or bowl may be removed entirely by unhooking the three supports. A damp cloth quickly removes all dirt or dust.

In HOSPITALS a patient may lie in bed with the room fully illuminated without eye fatigue.

Radiographic and X-Ray Room, Peralta Hospital, Oakland, California
Showing Lighting

By mounting this fixture in the corner of the X-Ray Room the electrical outlets are kept at the greatest possible distance from the aerials for the high frequency wires of the X-Ray equipment.

The outlet box should be placed not farther than 2″ from the corner of the room and from two to four of these units are required in each room. This unit directs the light to the ceiling thus eliminating the direct rays of light from coming in contact with the operator's eyes.

The above fixture is used as a Night Light in Corridors and Patients' room.

In Corridors the light is placed in the walls, approximately 18″ from the floor, at intervals of from 20 to 30 feet, which gives satisfactory illumination and eliminates the possibilities of any light coming thru the transom and disturbing the Patient.

In Patient's Room the light is placed approximately one foot from the floor in a position where it will be out of the line of vision of the Patient. This will produce sufficient illumination for the Nurse to see to inspect the room and will not disturb the Patient.

The NEW NOSHADOLITE

Patent No. 1663656 *Trade Mark Registered*

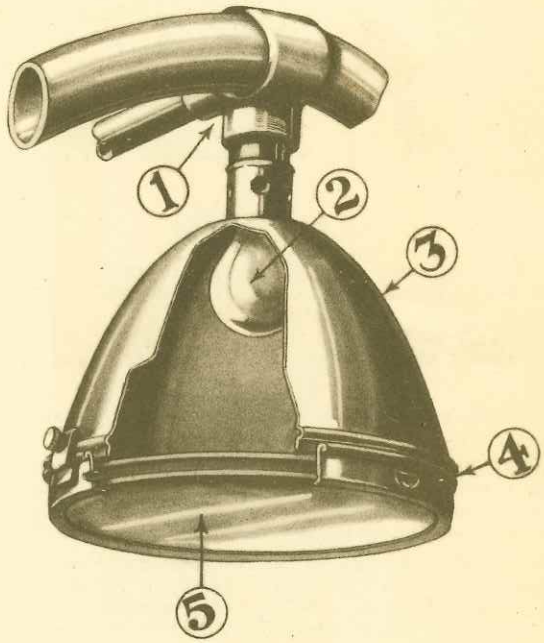
1. The reflectors are firmly and rigidly attached to the ring at equi-distant points by heavy cast brass fittings at the correct angle, and cannot get out of alignment.

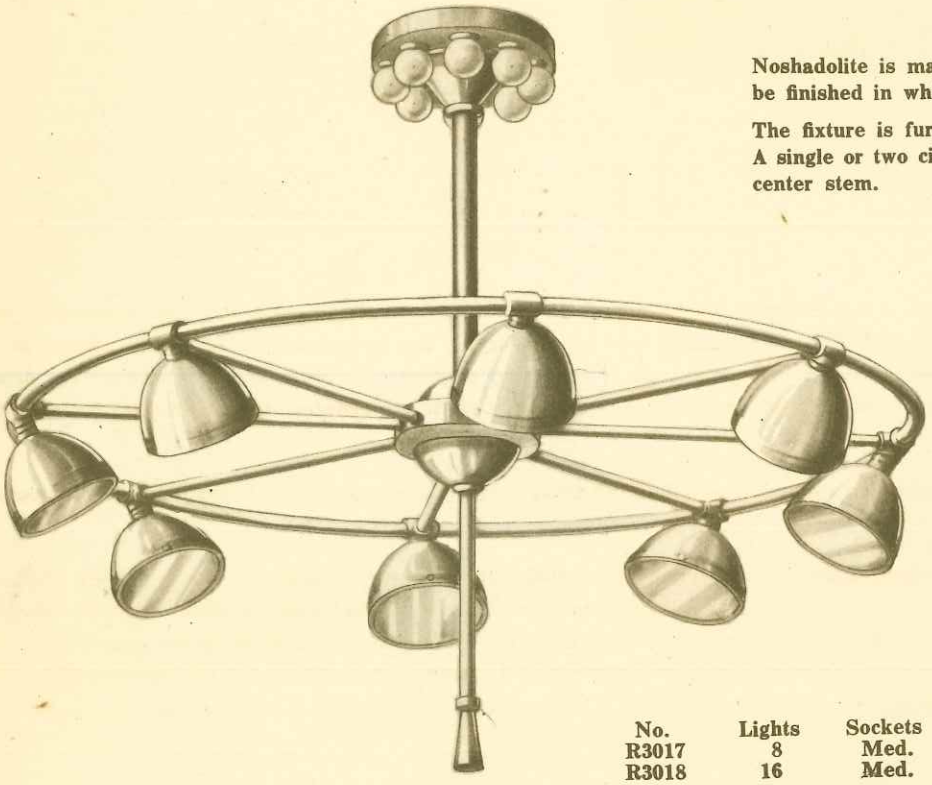
2. Each reflector is equipped with 50 watt type "A" (inside frosted) Mazda Lamp.

3. The reflectors are made of heavy spun brass with ventilated hood and socket. They are silver plated, highly polished, then given a double coat of special heat resisting varnish on reflector surface and dull silver on outside. The curves of the parabolic reflectors have been scientifically plotted to permit 85% of the light rays emanating from the lamps, to be focused with greatest intensity on the 18 inch field of area.

4. Attached to the bottom of the reflector is a hinged frame holding two glass insulating plates, locked with knurled heat set screws, making it an easy matter to clean reflectors.

5. Double glass plates of heat resisting glass with intervening space ventilated stops the radiant and reflected heat so that the increased temperature is only 2 degrees. Also protects the polished surface of reflectors from discoloration, oxidation, or disintegration caused by the fumes of iodine or other solutions in surgical procedure.





Noshadolite is made of brass, finished in dull nickel, or may be finished in white enamel, if desired, at an extra charge.

The fixture is furnished wired either for one or two circuits. A single or two circuit switch can be provided attached to the center stem.

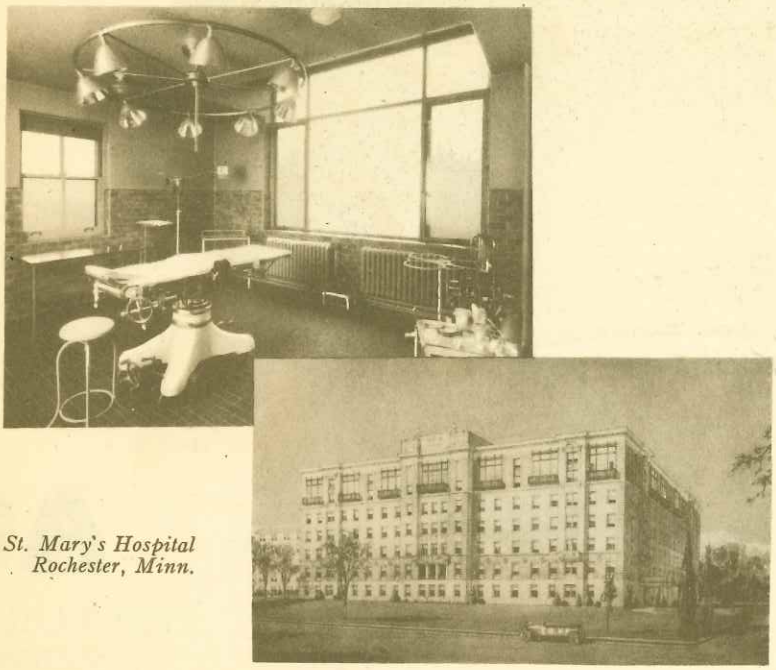
No.	Lights	Sockets	Diam.	Lgth.	Price	Code
R3017	8	Med.	72″	60″	$310.00	Team
R3018	16	Med.	72″	60″	325.00	Tear

Additional Length $3.00 List Per Foot

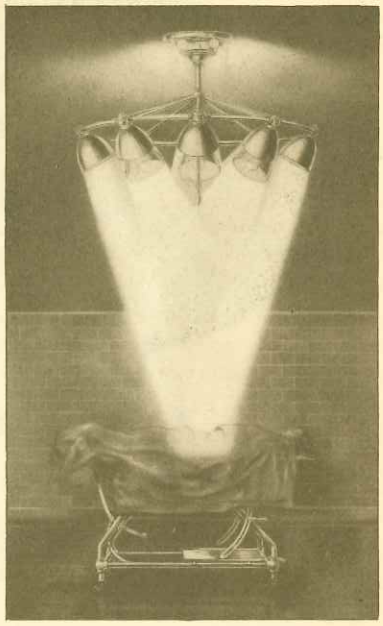
NOTE: To secure the best results, the fixture should be mounted 8'6″ from the floor to the reflector ring. This will insure the proper focusing of the reflected light beams on the operating field. For this reason the ceiling height must be given when ordering. The voltage of current in use by the hospital should also be given.

PATENT OFFICE
FEB 15 1930

The NEW NOSHADOLITE



St. Mary's Hospital
Rochester, Minn.



Noshadolite illustrating the great volume of light produced and concentrated on an 18" area of the operative field.

WHEN eight parabolic reflectors, placed at equi-distant points on a six-foot ring, are focused on a given field, the illumination is intense and all shadows are practically eliminated. The source of light is so near the ceiling that no increase of heat is noticeable at the level of the operator's head. Beams of light at eight sources meeting at an angle of 45 degrees eliminates the shadows which obscure the depth of certain wounds. This will be especially appreciated in certain common duct operations, pelvic proceedures, attempts to reach the root of the Gasserian ganglion, and others of like nature.

The satisfaction of having a known quality and constant quantity of light at all times is one which cannot be fully appreciated by the operator, who has not had it in his possession.

The Noshadolite is the most scientifically designed fixture for the illumination of the surgical operative field that has ever been offered the medical profession. The fixture consists of a ceiling plate, canopy, connecting pipe, six foot reflector ring, eight parabolic reflectors attached to the ring at the correct angle, set at equi-distant points on the ring, universal joint (ball and socket mechanism) in the center of the ring, and switch and control handle in connection with the Universal joint by means of which the angle of the reflector ring may be instantly changed. The lamps in canopy are for general illumination.

Guth-Galax Unit, a combination of the New Galax Glass and a porcelain enameled reflector produces an abundance of well diffused light on the working plane—Galax Glass is both glareless and shadowless. Part of the light from Guth-Galax is diffused and transmitted through the bottom of the globe. The rest of the light is reflected back through the sides and reflected from the perfectly glazed porcelain enameled reflector, which directs all of the useful light to the working plane.

Ideal for Schools, Offices, Stores, Hospitals and Public Buildings.

Ventilation promotes better health. The circulation of air not exceeding 300 feet per minute velocity will not cause injurious drafts and will promote dissipation of heat from the body by evaporation of perspiration.

Comprehensive experiments conducted with many subjects has proven that the increase of body temperature causes restlessness, irritability, palpitations of the heart, soreness of the eyes, laziness and confusion.

Guth-Fan drawing air upward at a low velocity throwing it outward toward the walls at an average speed of 300 feet per minute 3 feet from the center of the fan will carry very little dust. Most every other type of mechanical fan lifts and circulates dust which is a most dangerous element to health.

The GUTH-FAN, a revolutionary principal of moving air wherein the supply is drawn upward in a column and forced outward from a revolving disc in a conoidal shape below the horizontal line. The air movement is continuous in all directions to the walls, downward, then back towards the center of the room and up to the fan blade. It does not materially move the warmer air at the ceiling. It revitalizes by reason of the horizontal strata, moving the air through all open spaces and by circulating only the fresh cool drawn up from below the level of the blade. It effectively cools the body through constant and general movement of all the air that is occupied. It does not pick-up and consequently load the air with dust which is a most harmful element to respiratory organs.

The GUTH-FAN permits of the application of good lighting units, as the fan discs does not cause flickering light. The illumination intensities, distribution and principal can be definitely controlled and built on to the unit so that the usual eye strain and weariness result from other types of fan fixtures is eliminated. When installed over desks, papers are not blown away and when installed over a dining room table, food is not cooled, nor are the food odors blown towards you. The room center is the proper place for efficient attractive illumination, and also the best location for an air circulator, so that the joint problem is solved with the GUTH-FAN.
